1 Introduction

This calculator is designed to help users assess the fiscal effect of a select housing development in New Hampshire. Given the structure of the tool and its wide geographic scope, the calculator provides illustrative results based on unique tax rates and comparable municipal-level average assessment rates – as such, the tool does **not** provide a site-specific analysis and should be interpreted as a high-level analysis on the interaction of property tax assessments; property tax rates; municipal expenditures; and residential density within New Hampshire's diverse set of municipalities.¹

Before using the calculator, users should have the following information:

1. Municipal Location of Development
2. Development Unit Count
3. Type of Housing and Market Position (Market Rate or Workforce/Age Restricted, Single Family, Middle Density or Multifamily)²

¹ Please refer to the Appendix for additional information on approach and methodology.

² Workforce housing which is intended for sale is housing affordable to households earning up to 100% of the area median income for a 4-person household, or for rental units, up to 60% of the area median income for a 3-person household as per New Hampshire statute ([RSA 674:58, IV](#)). Age restricted housing is intended for people 55 years of age or older ([RSA 354-A:15, VIII\(3\)](#)). Single-family homes are fully detached dwelling units. Middle density housing reflects a range of housing types that fall between single-family homes and large apartment complexes. It includes duplexes, triplexes, and quadplexes. Multifamily housing is defined as one building with five or more units.

2 Calculating Fiscal Estimates

2.1 Parts of the dashboard

a. Landing Page

The landing page provides an overview of the calculator, including its purpose and key functionalities. It consists of:

- A brief introduction explaining the tool's objective.
- Definitions and illustrations of various housing typologies.
- Users may also follow direct links to sources and technical documentation.

Figure A: Landing Page Screenshot

b. Calculator

Figure B: Calculator Screenshot

The screenshot shows the 'Fiscal Analysis of Housing' calculator interface. At the top, there is a header with the title 'Fiscal Analysis of Housing' and the logo for the 'New Hampshire Department of BUSINESS AND ECONOMIC AFFAIRS'. Below the header, there is a section titled 'Using the calculator' with a brief instruction: 'Enter the details below to estimate fiscal impact. Please refer to the User Guide for the methodology and model parameters.' The main content area contains four numbered dropdown menus for selection: 1. Municipality (set to 'All'), 2. Number of Units (set to 'All'), 3. Housing Type (set to 'All'), and 4. Housing SubType (set to 'All'). Each dropdown menu has a small 'v' icon indicating it can be expanded. The background of the interface features a row of colorful, stylized house illustrations.

When the user opens the calculator, selection options will appear on the left. The screen will otherwise be blank. As selections are applied, output sections will populate, as illustrated in Section 3 of this guide.

The calculator is structured into distinct sections to ensure smooth navigation:

- **User Input:** Filters for selecting the development location and characteristics.
- **Municipal Profile:** Key statistics about the selected municipality.
- **Housing Need and Unit Count:** Additional data to place the user selections in context of the broader housing need based on estimates from the selected municipality's Regional Planning Commission for 2040.

- **Fiscal Estimate:** The revenue and expenditure estimates of the development and the net fiscal estimate for the municipality and the estimated change in the property tax bill for the homeowner of a median valued home.³

³ The latter figure makes this estimate assuming all things were held constant in the town – such as the municipal budget – remain the same from the prior year.

3 Step by Step

Step 1: Select Municipality

- Choose the municipality to be used within the analysis.
- The dashboard will update to show relevant local data within the 'Municipal Profile' and 'Housing Need' boxes.

Step 4: View Results & Analysis

1. The output for the selected sample development includes seven key figures:
 - i. **Estimated Municipal Tax Revenue:** The total net revenue the municipality receives from the overall development, factoring in fees, taxes, and incentives.
 - ii. **Estimated Municipal Services Cost:** The total net expenditure the municipality incurs for supporting the development, including local infrastructure, public services, and school and administrative expenses.
 - iii. **Estimated Net Impact:** The difference between the Municipal Services Cost and Municipal Tax Revenue.
 - iv. **Estimated Municipal Tax Revenue per Unit:** The net revenue the municipality gains from each newly constructed unit through taxes.
 - v. **Estimated Municipal Services Cost per Unit:** The net cost incurred by the municipality per newly constructed unit.
 - vi. **Estimated Impact per Unit:** The difference between the Municipal Services Cost per unit and Municipal Tax Revenue per unit.
 - vii. **Estimated Property Tax Change:** The net fiscal estimate of the development may factor in future adjustments to the municipality's property taxes. The "impact on taxpayers" measure calculates how the property tax bill would change for the owner of a median priced home per new unit constructed, assuming the construction of the development and holding all other factors equal.

New Hampshire Department of Business and Economic Affairs

Fiscal Analysis of Housing Calculator – Supporting Data Sources and Methodology

April 2025

Context

New Hampshire’s Department of Business and Economic Affairs (“BEA”) commissioned Econsult Solutions Inc. (“ESI”) to create an interactive online tool that estimates the fiscal impacts of the development of different housing typologies in municipalities across the state. The purpose of this tool is to assist local officials, stakeholders and members of the public in better understanding the fiscal impact of residential development choices as they seek to meet the housing needs of their respective communities.

The information below describes the supporting data sources and methodology used by ESI to complete the analysis supporting the modeled fiscal impact results and the interactive online tool.

The memorandum is divided into the following sections:

1. **Municipal Typologies**, documenting the clustering or grouping together of New Hampshire municipalities to analyze representative fiscal impacts across differing community types.
2. **Housing Typologies**, documenting the analysis of residential building types by typology to establish assessed building values for the fiscal model, household composition estimates, and realistic user input restrictions.
3. **Revenue Analysis**, documenting the analysis of modeled assessed values for new housing development and their interaction with property tax revenues.
4. **Expenditure Analysis**, documenting the analysis of municipal budget expenditures and school expenditures and their interaction with estimates of new residents and school-aged children by development type.
5. **Fiscal Impact Analysis**, documenting the calculation resulting in net fiscal impact estimates.
6. **Model Disclaimers and Limitations**, documenting limitations to the methodology of this analysis and the context for understanding estimates.

1 Municipal Typologies

New Hampshire is home to 234 municipalities, each with different population sizes and density, tax bases and municipal infrastructure. Given the range of differences between New Hampshire’s diverse set of municipalities, typologies – or groupings of cities and towns – were established to create average-basis estimates for variables within the fiscal model.

Several variables were considered while clustering and grouping the typologies, including but not limited to:

- Population
- Population Density
- Total Housing Units
- Single Family to Other Housing Type Ratio
- Residential to Other Land Use Ratio
- Municipal Infrastructure and Service Availability
- Municipal Revenues and Expenditures
- Assessed Total Values
- Assessed Land Values
- Assessed Building Values

The set of data used to establish the municipal typologies was drawn from several key sources, including population and housing unit data from the American Community Survey; municipal budget data from the New Hampshire Public Finance Consortium; and parcel data from New Hampshire’s Department of Revenue Administration. Prior to all analysis, any dollars or figures listed in earlier years were inflation-adjusted to 2024.

The grouping analysis led to seven municipal typologies, each grouped together based on similarities within key variables including but not limited to population, population density and available municipal services. Appendix A outlines the municipal groupings. Very generally, population, density and available public services – among other variables – ultimately impact the upper bounds of local assessed values. Each typology was made to group municipalities with similar characteristics within scaling population and density thresholds to reflect that effect. Once groupings were established, assessment and budget profiles were created for the typology based on average figures. In other words, the data utilized within the model are reflective of assessment and budget data for similar municipalities in the same grouping, rather than one specific municipality or state-level averages. The figure below includes the defining features and metrics associated with each typology.

Figure 1.1 : Municipal Typology Overview

Typology	Typology Description	Municipality Count	Median Population	Municipal Service Profile ¹
1	New Hampshire's Largest Municipalities	3	90,943	Full
2	Suburban Municipalities	27	16,151	Full
3	Municipalities with Diverse Property Tax Base	50	4,851	Full
4	Municipalities with Primarily Residential Tax Base	34	4,624	Mixed
5	Seasonal Municipalities	15	2,507	Mixed
6	Rural and Low Residential Density Municipalities	57	1,758	Mixed
7	Municipalities with Limited Public Services	48	713	Limited

Source: ESI Analysis of New Hampshire Public Finance Consortium Data (2025)

To avoid any skew within the data, Typology 5 was created as a unique grouping to capture smaller municipalities with high assessed property values. Generally, this is inclusive of seasonal resort towns with unique amenities. Please refer to Appendix A for a full list of municipalities within each Typology. Within the broader set of municipalities in New Hampshire, there are also 25 unincorporated places with extremely small populations and no discrete or discernible municipal structure allowing for a fiscal impact analysis. These unincorporated places have been excluded from the analysis and are not selectable by users within the calculator. Please refer to Appendix B for a list of the locations excluded from the analysis. Upon finalizing the municipal typologies, parcel data for each municipality and housing typology were analyzed to establish median residential parcel sizes. As such, the size of the land is fixed to the user's municipal selection (and its corresponding municipal typology).

¹ While most New Hampshire municipalities rely solely on local public service provision, some municipalities also rely on county service provision. Given available information within the New Hampshire Public Finance Consortium Database, towns were analyzed based on which available services were provided budget, the amount of budget, and the general use or reliance on shared services (such as county sheriffs in place of a local police force). Other considerations included observed utilities, such as water and sewer treatment facilities, and associated infrastructure. Municipalities that held their own public safety units and local utilities and public service infrastructure were considered towns with 'full' municipal service profiles. Municipalities that listed county departments as lead points of public safety and utility infrastructure, and their own municipal departments for another were considered as having 'mixed' municipal service profiles. Municipalities with no local leads or spending in public safety and utility infrastructure were considered as having 'limited' municipal service profiles.

2 Housing Typologies

The shortage of housing in New Hampshire exists across the development landscape and represents unmet needs of residents across the age and income spectrum. Three primary housing development typologies were established for the analysis to compare development choices that are typical for a wide range of housing needs in New Hampshire:

- Single Family (1-unit properties);
- Middle Density (2- to 4-unit properties); and
- Multifamily (5 or 5+ unit properties).

Within these housing typologies, sub-typologies were created – reflective of the different needs and market types required to address New Hampshire’s housing shortage. This includes:

- Market Rate;
- Workforce;² and
- Age-Restricted.³

Using the parcel data from the New Hampshire Department of Revenue Administration, residential parcels were grouped into the three housing development typologies depending on the parcel’s building type designated by its state land use definition. The table below shows which building types were rolled into the broader typologies.

² Per New Hampshire law, workforce housing is defined as housing which is intended for sale affordable to households earning up to 100% of the area median income for a 4-person household, or for rental units, up to 60% of the area median income for a 3-person household ([RSA 674:58, IV](#)). For the purpose of this analysis, workforce housing follows New Hampshire law and is generally defined as fully workforce, deed-restricted housing.

³ Per New Hampshire law, age-restricted housing is intended for people 55 years of age or older ([RSA 354-A:15, VIII\(3\)](#)). For the purpose of this analysis, age-restricted housing follows New Hampshire law and does not include assisted living facilities.

Figure 2.1 : Building Types within Housing Development Typologies

Housing Development Typology	Relevant State Land Use Definitions	Parcel Count (Built 2004 – 2023)
Single Family	“Single Family Home”	45,550
Middle Density	“Single Res Condo Unit” “Res Condo 2-4 Unit Bldg” “Multi Family 2-4 Units”	13,657
Multifamily	“Apt Bldg 5+ Units”	77

Source: ESI Analysis of NHDRA Parcel Data (2025)

Certain other restrictions and data cleaning methods were applied to create a final parcel dataset that was not skewed by outlier parcels. This included removing parcels with limited or no assessed value information; removing parcels with buildings with less than 250 square feet; restricting multifamily parcels to those with 10 or more units; and only keeping parcels that held build years from 2004 to 2023. These additional restrictions were applied to ensure that the parcel data was more representative of recent development – as the median figures establish the baseline assessed value and revenue estimates for the analysis.

Upon finalizing the housing typologies – as well as a base typology representing vacant lots – parcel data for each municipality and housing typology were equalized to adjust for differences in municipal assessment practices and then analyzed to establish median assessed values per acre. These estimates were applied against the median land size by municipal typology to establish an estimated assessed value per acre. In instances with a limited number of observations or a high number of outliers within the parcel data, conservative land value estimates were developed by averaging other value per acre estimates for the municipal typology. The table below indicates the size of the land and corresponding assessed value.

Figure 2.2 : Assessed Value Assignment by Municipal Typology and Housing Development Typology⁴

Municipal Typology	Housing Type	Median Land Size (Acre)	Median Assessed Value per Acre
1	Vacant	0.2	\$4,029
1	Multifamily	0.2	\$573,762
1	Middle Density	0.2	\$535,276
1	Single Family	0.2	\$496,790
2	Vacant	0.25	\$4,739
2	Multifamily	0.25	\$259,734
2	Middle Density	0.25	\$246,372
2	Single Family	0.25	\$233,011

4	Vacant	2	\$4,237
4	Multifamily	2	\$31,077
4	Middle Density	2	\$67,066
4	Single Family	2	\$103,056
5	Vacant	1.25	\$28,716
5	Multifamily	1.25	\$313,824
5	Middle Density	1.25	\$257,385
5	Single Family	1.25	\$200,946
6	Vacant	2.25	\$7,751
6	Multifamily	2.25	\$163,252
6	Middle Density	2.25	\$102,195
6	Single Family	2.25	\$41,137
7	Vacant	5	\$1,825
7	Multifamily	5	\$23,093
7	Middle Density	5	\$25,872
7	Single Family	5	\$20,313

Source: ESI Analysis of NHDRA Parcel Data (2025)

The assessed land value expressed in Figure 2.2 was used with a density multiplier to estimate how much land is needed for development scenarios, as well as the land value premium conveyed by denser development. Middle density units were estimated to require half as much land per unit as single-family homes, and multifamily units were estimated to require a tenth as much land per unit as single-family homes. These multipliers were used to modify land size and value estimates determined by municipal and housing typologies to generate a new estimated land value. The new land value was subtracted from the value of a vacant parcel of the same size, to find the land value premium. In other words, the resulting figure is the added land value conveyed by the proposed development upon an otherwise vacant parcel of land.

⁴ The fiscal impact analysis was completed with unrounded, actual numbers derived from the various referenced data sources. The online tool represents all dollar figures rounded to the nearest \$100. Values reported in this table are adjusted to 2024 dollars.

Due to New Hampshire’s historic development patterns, the parcel count for the multifamily typology remained too low to establish representative assessed building value figures based strictly off assessment data from comparable parcels. As such, estimated differential figures for assessed value per square foot were used for the multifamily housing typology. For both the single-family and middle density typologies, the classified parcel data was then used to establish assessed values per square foot for each housing and municipal typology. Of note, square footage was held constant within each municipal and housing typology – single-family units are sized at 2,000 square feet, middle density units are sized at 1,100 square feet, and multifamily units are sized at 900 square feet.⁵ The figure below shows the assessed value per square foot for each market rate housing typology and municipal typology.

Figure 2.3 : Market Rate Assessed Value per Building Square Foot by Housing Development Typology and Municipal Typology

Municipal Typology	Single Family – Market Rate Assessed Value per Square Foot	Middle Housing – Market Rate Assessed Value per Square Foot	Multifamily – Market Rate Assessed Value per Square Foot
1	\$195	\$298	\$256
2	\$174	\$364	\$278
3	\$160	\$207	\$191
4	\$158	\$213	\$194
5	\$192	\$304	\$259
6	\$150	\$187	\$177
7	\$139	\$156	\$155

Source: ESI Analysis of NHDRA Parcel Data (2025)

After the parcels were grouped into their appropriate typologies, further analysis was completed to establish workforce housing and age-restricted housing sub-typologies. To establish the workforce housing sub-typology, parameters were set to both identify pre-existing workforce housing as defined by New Hampshire law, as well as those parcels that were both smaller in square footage and at lesser assessed value. For this analysis, single family workforce housing and middle density workforce housing parcels are defined as those that are within the bottom two quintiles of square footage and assessed value. Like the estimated multifamily differentials, the workforce multifamily housing applies the same method to provide a conservative estimate in the absence of information within the available historical parcel data.

In addition to the workforce housing sub-typology, an age-restricted sub-typology was established in the multifamily category. Like the multifamily category itself, the limited number of current age-restricted multifamily development examples within the parcel data required the use of an estimate. Given the nature of age-restricted multifamily housing – which restricts eligible tenants to those ages 55 and older but holds other comparable market features – the estimated assessed value derived for this sub-typology has been set as the mid-point between the assessed value per square foot estimate of workforce and market rate multifamily housing for each municipal typology.

⁵ Per FRED, the median square footage for New Hampshire homes – inclusive of all unit types – is 1,875 square feet as of March 2025. [Housing Inventory: Median Home Size in Square Feet in New Hampshire \(MEDSQUFEENH\) | FRED | St. Louis Fed.](#)

To estimate the household composition of the units within the new housing development, U.S. Census Bureau Public Use Microdata Samples (PUMS) was used to establish household composition and school age children estimates for each housing development typology. Due to sample size considerations, this data was analyzed at the statewide level – as such, the estimates are the same across the municipal typologies. These figures were then supplemented by research, including estimates from New Hampshire Housing’s *From Homes to Classrooms 2024* report.⁶ The table below outlines the household composition and school age children estimates established for each typology.

⁶ The figures on school age children per housing unit provided by the New Hampshire Housing report relies on an estimate from a survey of several property managers from across New Hampshire. Given the lag of U.S. Census data and the desire to produce modeled results reflective of new construction, the school age children estimate for middle density and multifamily units used within this model uses a conservative mid-point estimate between the findings of that report and the public use microdata. The 2024 report can be found here: https://www.nhhfa.org/wp-content/uploads/2024/09/From_Homes_To_Classrooms_2024.pdf.

Figure 2.6 : Household Composition and School Age Children Estimates

Housing Development Typology	Household Size	School Age Children
Single Family	2.40	0.40
Middle	2.10	0.10
Multifamily – Market + Workforce	2.10	0.10
Multifamily – Age-Restricted	2.02	0.02

Source: ESI Analysis of U.S. Census Bureau 2019-2023 Public Use Microdata (2025)

After selecting a housing typology, users select the number of units within the development. For the purposes of this analysis, it was assumed that multiple building structures and lots would be needed for multiple units of single-family and middle density housing. This means while the number of units in a single-family home is capped at one, and the number of units in a middle density building is capped at four, the total units in a development of each of these typologies can exceed these thresholds.

- The single family and middle density typologies allow for up to 40 units. The unit selection is available in increments: 1 (single family only), 2, 3, 4, 5, 10, 15, 20, 40.
- To reflect the greater density of multifamily, users may select up to 200 units for municipal typology 1 and up to 100 units for the other municipal typologies. The available selections are as follows: 5, 10, 15, 20, 40, 60, 80, 100, 150, and 200.

The unit restriction on the selections allowed for multifamily developments is meant to reflect maximum feasible development sizes reflective of current demand and market conditions within the municipal typologies. For example, a town with a higher relative population – such as those in Typology 1 – has a housing market that could support a 200-unit apartment complex, whereas a town with a smaller relative population would be less likely to support that from a demand or infrastructure perspective.

3 Revenue Analysis

Local revenue for New Hampshire municipalities is derived primarily from local property taxes.⁷ As such, the model estimates the taxable assessed value of a proposed development, reflecting the selections made by a front-end user. Users select a municipality; a housing typology and sub-typology; and a unit count (which determines the overall size of the development). Together, this information is used within the model to provide an estimated total assessed value for the development chosen by the user.

⁷ [How We Fund Public Services in New Hampshire | New Hampshire Municipal Association](#)

Figure 3.1 : Revenue Analysis Flow Chart

Source: ESI (2025)

For the revenue analysis, the estimated assessed values were adjusted for equalization and inflation and applied against the unique local property and education tax rates – specifically the 2024 municipal property tax rates and the 2024 local education property tax rates - from 2024 corresponding to the municipal selection made by the front-end user. The resulting tax revenue estimate for the development is then expressed by the calculator.⁸

4 Expenditure Analysis

In New Hampshire municipalities, municipal budgets and their corresponding expenditures – exclusive of debt service, capital outlays and other operating transfers – are largely tied to public service provision. Typically, New Hampshire budgets have several sub-categories – those include general funds; safety; highways and streets; sanitation; health; welfare; culture and recreation; and conservation and development.⁹ New Hampshire municipalities also have available funds for debt service, capital outlays and operating transfers. As the cost of debt service, capital outlays and operating transfers tend to fluctuate annually and are not impacted by the addition (or subtraction) of a singular development, these costs were not considered within this analysis. In addition to these expenditures, the analysis did not include any expenditures associated with water and sewer – which in some instances is paid for through municipal property tax revenue when the utilities are municipally-operated, but in many instances is paid for by the application of special fees and assessments exclusive of property taxes when the utilities are operated by a non-municipal entity.

Budget data was utilized through the New Hampshire Public Finance Consortium’s public platform, which held budget data through 2022.¹⁰ Prior to completing the analysis, all budget dollars were adjusted to 2024 dollars. Following that, the expenditures were summed for each municipality and divided by the municipality’s population to establish per capita expenditure estimates for each municipality, and the median figure was assigned to each

⁸ Within the budget process, revenues are typically matched to expenditures by setting the millage rate. As such, the figures presented in this analysis is representative of the new value in the tax base, translated to revenue at the current millage rate. Any practical effect on new revenues would depend on net impacts from that development and associated millage changes.

⁹ Some New Hampshire municipalities also own municipally operated airports or water and electric utilities. In 2022, only 10 municipalities showed airport expenditures, while 27 municipalities showed expenditures for water or electric utilities. Due to the limited frequency and size of these budget expenditures, they were removed from this analysis.

¹⁰ [NH Public Finance Consortium - Data](#)

municipal typology. Within the model, these per capita expenditure estimates were then applied against the estimated population of the developments.

Figure 4.1 : Expenditure Analysis Flow Chart

Source: ESI (2025)

Similarly, the model uses an estimate of the local share of per pupil costs reported by the New Hampshire Department of Education. This local share estimate was established by analyzing school district budgets and identifying the amount of state and federal aid within the budget. The delta between the total budget and state and federal aid represents the estimated local contribution to the budget, which could be represented as a share of the total budget. This local share was then applied against the per pupil costs to establish the local per pupil cost. This dollar figure was then applied against the total school age children to establish a total cost estimate for the hypothetical development.¹¹

Figure 4.2 : Expenditure per Capita and Median Local Per Pupil Cost

Municipal Typology	Expenditure per Capita	Median Local per Pupil Cost
1	\$1,487	\$8,993
2	\$1,336	\$11,134
3	\$1,020	\$12,938
4	\$983	\$12,368
5	\$2,259	\$14,040
6	\$1,260	\$15,153
7	\$1,043	\$13,752

Source: ESI (2025)

Following the available literature, the model also reflects the impact of increased density on municipal expenditures which has found that higher population density is associated with lower per capita municipal spending due to economies of scale in service provision. Following the regression analysis methodology utilized within the literature, a similar model was developed to understand the same relationship in New Hampshire.¹² Controlling for relevant variables, such as population; percentage change in population; per capita income; housing stock age; and the share of single-family homes within the total housing stock, our analysis found a similar

¹¹ Local pupil costs are unique to each municipality and were based on data from the New Hampshire Department of Education, <https://www.education.nh.gov/who-we-are/division-of-educator-and-analytic-resources/bureau-of-education-statistics/financial-reports>.

¹² Mattson J. Relationships between Density and per Capita Municipal Spending in the United States. *Urban Science*. 2021; 5(3):69. <https://doi.org/10.3390/urbansci5030069>.

negative relationship between population-weighted density and per capita municipal spending – interpreted as for each 10 percent increase in density, an associated reduction in municipal spending of 1.3 percent.

In an applied example, the per capita estimate applied to the first person added in Typology 1 is \$1,487 – the second person has a rate of \$1,486, the third person has a rate of \$1,484, and so forth – exponentially decreasing as the greater population addition increases the impact on population-weighted density. The figure below represents how the per capita expenditure estimates decline for each additional person as the population-weighted density increases.

Figure 4.3 : Expenditure per Capita and Marginal Addition of People

Source: ESI (2025)

Within the model, the per capita expenditure amount was applied on a marginal basis associated with the elasticity based on the relationship derived from the regression analysis. As such, each additional person added within the model was assigned a marginally lower per capita cost estimate.¹³ This ‘density discount’ was applied to each additional person (beyond the first) added in the middle density and multifamily housing typologies.

After establishing a total population expenditure estimate, a final discount was applied to represent vacancy. This vacancy assumption was applied to total population expenditure estimates derived from the multifamily housing

¹³ In practice with hypothetical numbers, this would reflect in the model as person 1 receiving a \$10 per capita expenditure estimate; person 2 receiving a \$9.95 per capita expenditure estimate; and so forth.

development typologies – no vacancy assumption was applied to expenditure estimates derived from the single-family or middle density typologies.¹⁴

A proposed development – such as a subdivision of multiple single-family units – may also require the development of new roads. As such, the cost of new road maintenance to the municipality – or a subdivision expenditure – was estimated for single family developments with two or more units and middle density developments with five or more units. Generally, the model assumes that single family and middle density developments below these thresholds – as well as multifamily developments – are assumed to be infill, thus relying on pre-existing roads and not adding to the municipality’s road maintenance expenses. The subdivision expenditure was applied only to larger, lower-density developments as these were the most likely to require new road maintenance costs.¹⁵ The cost of light road maintenance was estimated at \$11 per linear foot based on figures from local Road Surface Management System Assessment estimates, which are utilized by municipal planning departments across New Hampshire. This rate was applied to the frontage of each property, which was calculated based on the land size for the municipal type assuming a square lot. The subdivision cost doubles every two units for single family and every four units for middle density as both sides of a road can support development.

Figure 4.4 : Subdivision Expenditure

Municipal Typology	Single-Family Expenditure (Base - 2 units)	Middle Density Expenditure (Base - 5 units)
1	\$1,018	\$1,018
2	\$1,138	\$1,138
3	\$3,219	\$3,219
4	\$3,219	\$3,219
5	\$2,544	\$2,544
6	\$3,414	\$3,414
7	\$5,089	\$5,089

Source: ESI Analysis of Road Surface Management System Assessments (2025)

Figure 4.5 : Subdivision Expenditure, Scaling of Municipal Typology 1

Source: ESI Analysis of Road Surface Management System Assessments (2025)

¹⁴ Following available market data for New Hampshire, as well as available data from New Hampshire Regional Planning Commissions’ Regional Housing Needs Assessments, a vacancy rate of 5% has been applied to the middle and multifamily typologies.

¹⁵ While the ownership and cost of maintenance for subdivision roads can vary in New Hampshire, this analysis assumes the municipality carries 100% of the associated cost of the road maintenance for these types of developments.

Simply put, the model estimated total expenditure estimates derived from the sum of the population expenditure estimates, the school-age children expenditure estimates and, when applicable, the subdivision expenditure estimates.

5 Fiscal Impact Analysis

Using the results from the revenue and expenditure analyses, the model produced net fiscal impact estimates for each hypothetical development. Within the user interface, this is represented as the sum figure of the revenue estimate measured against the expenditure estimate for the development. These estimates are provided in multiple formats: property tax revenue per development and per unit (or the per development figure divided by the number of units within the hypothetical development); expenditure per development and per unit; the net figure per development and per unit; and the associated change in the annual property tax bill per new unit added for a median priced home in the municipality (or the estimated monetary change to the median-priced home's property tax bill).¹⁶

Figure 5.1 : Output Results Definitions

Result	Definition
Estimated Municipal Tax Revenue	The total net revenue the municipality receives from the overall development, factoring in fees, taxes, and incentives.
Estimated Municipal Services Cost	The total net expenditure the municipality incurs for supporting the development, including local infrastructure, public services, and school and administrative expenses.
Estimated Net Impact	The difference between the Municipal Services Cost and Municipal Tax Revenue.
Estimated Municipal Tax Revenue per Unit	The net revenue the municipality gains from each newly constructed unit through taxes.
Estimated Municipal Services Cost per Unit	The net cost incurred by the municipality per newly constructed unit.
Estimated Impact per Unit	The difference between the Municipal Services Cost per unit and Municipal Tax Revenue per unit.
Estimated Property Tax Change	The net fiscal estimate of the development may factor in future adjustments to the municipality's property taxes. The "impact on taxpayers" measure calculates how the property tax bill would change for the owner of a median priced home per new unit constructed, assuming the construction of the hypothetical development and holding all other factors equal.

Source: ESI (2025)

The property tax impact for a homeowner was calculated by adjusting the selected municipality's tax base by the value of the new development. The net impact of the development is then divided by this figure. To estimate the impact on the property tax bill of an owner of a median-priced home, the result was multiplied by the assessed value of a median-priced single-family home (adjusted for inflation) in the development's selected municipality.¹⁷ The output reported by the calculator lists the impact to a homeowner's tax bill per developed unit. While municipalities only recalculate their property tax rate annually, this figure represents the impact of the property tax bill if the municipality immediately adjusted its property tax rate to meet its tax commitment and assumes all

¹⁶ Millage impact is calculated by finding a municipality's new millage rate through modifying the municipality's tax base (by the value of the new development) and the municipality's tax commitment (by the new development's net impact) then dividing. The new millage rate is then compared to the municipality's effective millage rate (current tax base divided by current tax commitment). While municipalities only recalculate their millage rate periodically, this figure represents the new millage rate a municipality would need to meet its tax commitment if all other expenses and revenues remained stable. To illustrate the impact on an existing property owner in the town, the millage difference can be applied to an assumed property value calculating the towns effective millage rate then comparing it to the towns new millage rate.

¹⁷ Six municipalities (Hudson, Lebanon, Plaistow, New Hampton and Northumberland) had too few observations to find a median assessed value. In those towns the state median assessed value inflated to 2024 dollars, \$408,667, was used.

other expenses and revenues remained the same in the following year. Summary tables by typology and housing development typology and sub-typology are listed in Appendix C.

Notably, the modeled results show a range of both net positive (where revenue estimates surpass expenditure estimates) and net negative (where expenditure estimates surpass revenue estimates) results by municipal typology and housing development typology. As noted earlier and to provide the appropriate context to the results, the figures derived from the model aim to present users of the online tool with a better understanding of the fiscal impact of average housing development across New Hampshire. The findings from the analysis show that increased unit density is associated with lower per unit impacts in most municipalities across the state, and in some instances, that the revenue from a new development in some municipalities may not be able to surpass its associated expenditure impact given current tax rates and service profiles.

6 Model Disclaimers and Limitations

Given the restraints and restrictions within the calculator – applied to provide methodological consistency – there are several disclaimers and limitations that should be considered.

- Does Not Anticipate Future Changes in Municipal Budgets, Tax Rates and Population
 - The model does not consider year-over-year changes to municipal budgets and tax rates; other growth in housing development; and general population changes – each of which would have an impact on the fiscal impact results. As such, results should be interpreted as an annual estimate based on recent budget figures and 2024 tax rates. Also, New Hampshire municipalities operate on 5-year revaluation schedules for property value reassessments. These schedules have not been considered within the model and treat all assessed value estimates from the parcel data as 2022 dollars inflation-adjusted to 2024.
- Does Not Consider Certain Budget Figures and Household Fees from Municipal-Adjacent Entities
 - Municipal property tax revenue and local education tax revenue are the only two revenue sources considered within this analysis. As such, the only local expenditures considered were those financed by those sources. A typical property tax bill includes a municipal, local education, state education, and county tax rate. Since this analysis is meant to analyze impacts within municipal geographies, other costs and expenditures outside of these purviews – including water and sewer utility payments that are often set as fees – have been excluded.
- Does Not Consider Parcel Location and Other Neighboring Land Uses
 - Similarly, the analysis does not consider the direct location of the development. Although municipal-specific property tax rates have been applied to determine revenue from the property, the assessed values were estimated on an average basis from parcels across municipalities to derive values that could be supported by higher *n* counts. Notably, the actual location of a parcel for a development within a municipality – along with its neighboring parcels and their unique land uses – would play a significant factor in the assessed value of both the land and the building. As found in New Hampshire Housing’s 2019 Report *From the Outskirts to Downtown: Taxes, Land Use and Value in 15 New Hampshire Communities*, land productivity and assessed values of residential land uses increase substantially in dense, central cores as compared to municipal exurbs in communities across the state.¹⁸ Given front-end user selection limitations, the model has not been adjusted to reflect this spatial effect.

Appendix B

INDEX	NAME
1	Hadleys purchase, Coos County, New Hampshire
2	Chandlers purchase, Coos County, New Hampshire
3	Erving's location, Coos County, New Hampshire
4	Crawfords purchase, Coos County, New Hampshire
5	Dix's grant, Coos County, New Hampshire
6	Martins location, Coos County, New Hampshire
7	Odell township, Coos County, New Hampshire
8	Second College grant, Coos County, New Hampshire
9	Success township, Coos County, New Hampshire
10	Atkinson and Gilmanton Academy grant, Coos County, New Hampshire
11	Cutts grant, Coos County, New Hampshire
12	Beans grant, Coos County, New Hampshire
13	Kilkenny township, Coos County, New Hampshire
14	Livermore town, Grafton County, New Hampshire
15	Low and Burbanks grant, Coos County, New Hampshire
16	Beans purchase, Coos County, New Hampshire
17	Thompson and Meserves purchase, Coos County, New Hampshire
18	Cambridge township, Coos County, New Hampshire
19	Dixville township, Coos County, New Hampshire
20	Greens grant, Coos County, New Hampshire
21	Hale's location, Carroll County, New Hampshire
22	Millsfield township, Coos County, New Hampshire
23	Pinkhams grant, Coos County, New Hampshire
24	Sargents purchase, Coos County, New Hampshire
25	Wentworth location, Coos County, New Hampshire

Appendix C

Classification	Housing Type	Housing SubType	Median Revenue Per		Median Expenditure Per		Median New Net Impact	Median Change in Annual
			Unit Built	Unit Built	Unit Built	Unit Built		Property Tax for Median Priced Home per Unit Built
	1 Multifamily	Market Rate		\$3,225		\$3,776	-\$231	\$0.01
	1 Multifamily	Age Restricted		\$2,850		\$2,946	-\$37	\$0.00
	1 Multifamily	Workforce		\$2,475		\$3,776	-\$981	\$0.05
	1 Middle Density	Market Rate		\$5,052		\$4,102	\$1,271	-\$0.04
	1 Middle Density	Workforce		\$4,069		\$4,102	\$287	-\$0.01
	1 Single Family	Market Rate		\$6,465		\$7,668	-\$490	\$0.04
	1 Single Family	Workforce		\$5,054		\$7,668	-\$2,389	\$0.12
	2 Multifamily	Market Rate		\$3,697		\$3,534	\$166	-\$0.02
	2 Multifamily	Age Restricted		\$2,988		\$2,677	\$310	-\$0.05
	2 Multifamily	Workforce		\$2,279		\$3,534	-\$1,270	\$0.19
	2 Middle Density	Market Rate		\$6,198		\$3,889	\$2,275	-\$0.33
	2 Middle Density	Workforce		\$3,398		\$3,889	-\$515	\$0.09
	2 Single Family	Market Rate		\$5,797		\$8,280	-\$2,780	\$0.44
	2 Single Family	Workforce		\$4,767		\$8,280	-\$3,841	\$0.61
	3 Multifamily	Market Rate		\$2,988		\$2,646	\$281	-\$0.12
	3 Multifamily	Age Restricted		\$2,662		\$1,933	\$702	-\$0.37
	3 Multifamily	Workforce		\$2,336		\$2,646	-\$374	\$0.17
	3 Middle Density	Market Rate		\$5,156		\$3,301	\$1,799	-\$0.83
	3 Middle Density	Workforce		\$4,217		\$3,301	\$850	-\$0.37
	3 Single Family	Market Rate		\$7,122		\$9,162	-\$2,118	\$0.93
	3 Single Family	Workforce		\$6,071		\$9,162	-\$3,144	\$1.35
	4 Multifamily	Market Rate		\$2,246		\$2,556	-\$336	\$0.18
	4 Multifamily	Age Restricted		\$1,872		\$1,873	\$63	-\$0.04
	4 Multifamily	Workforce		\$1,498		\$2,556	-\$1,100	\$0.56
	4 Middle Density	Market Rate		\$3,686		\$3,228	\$450	-\$0.30
	4 Middle Density	Workforce		\$2,688		\$3,228	-\$544	\$0.32
	4 Single Family	Market Rate		\$6,297		\$8,852	-\$2,679	\$1.33
	4 Single Family	Workforce		\$4,959		\$8,852	-\$4,160	\$2.06
	5 Multifamily	Market Rate		\$1,491		\$3,521	-\$1,858	\$0.63
	5 Multifamily	Age Restricted		\$1,269		\$3,530	-\$1,982	\$0.58

Appendix C

Classification	Housing Type	Housing SubType	Median Revenue Per		Median Expenditure Per		Median New Net Impact	Median Change in Annual
			Unit Built		Unit Built		Per Unit Built	Property Tax for Median Priced Home per Unit Built
	5 Multifamily	Workforce		\$1,046		\$3,521	-\$2,347	\$0.78
	5 Middle Density	Market Rate		\$2,623		\$4,571	-\$1,705	\$0.61
	5 Middle Density	Workforce		\$1,941		\$4,571	-\$2,435	\$0.97
	5 Single Family	Market Rate		\$3,292		\$12,310	-\$7,656	\$3.22
	5 Single Family	Workforce		\$2,648		\$12,310	-\$8,472	\$3.39
	6 Multifamily	Market Rate		\$2,250		\$2,442	-\$129	\$0.09
	6 Multifamily	Age Restricted		\$1,907		\$1,929	\$62	-\$0.03
	6 Multifamily	Workforce		\$1,565		\$2,442	-\$851	\$0.59
	6 Middle Density	Market Rate		\$3,590		\$3,279	\$391	-\$0.23
	6 Middle Density	Workforce		\$2,670		\$3,279	-\$534	\$0.37
	6 Single Family	Market Rate		\$4,354		\$10,676	-\$6,049	\$4.58
	6 Single Family	Workforce		\$3,124		\$10,676	-\$7,295	\$5.71
	7 Multifamily	Market Rate		\$1,402		\$1,576	-\$117	\$0.25
	7 Multifamily	Age Restricted		\$1,149		\$1,164	\$74	-\$0.14
	7 Multifamily	Workforce		\$980		\$1,576	-\$551	\$0.94
	7 Middle Density	Market Rate		\$2,145		\$2,408	-\$242	\$0.46
	7 Middle Density	Workforce		\$1,642		\$2,408	-\$757	\$1.25
	7 Single Family	Market Rate		\$3,426		\$10,548	-\$6,644	\$12.94
	7 Single Family	Workforce		\$2,571		\$10,548	-\$7,557	\$14.58
